Abstracts

Presbyopia Correction Device general has two types' corneal inlay and Scleral Implants.

A corneal inlay (also called an intracorneal implant) is a device which is surgically implanted in the cornea of the eye as a treatment for presbyopia. Successful installation results in reducing dependence on reading glasses, so that the user can more easily engage in everyday tasks such as using a mobile phone, reading store shelf prices and working on a computer.

Corneal inlays are small, thin, and permeable. Typically one is implanted in the non-dominant eye.

Scleral Implants are precision-molded from a clear plastic material; the clear implants are about the size of a grain of rice and are placed just below the surface of the white of your eye (called the sclera). The only one commercially available is VisAbility Micro-Insert System.

In the last several years, United States market of presbyopia correction device developed rapidly, with an average growth rate of 187%. In 2016, global revenue of presbyopia correction device is nearly 1.95 M USD; the actual sales are near 2800 units.
