According to our (Global Info Research) latest study, the global Vacuum Linear Actuator market size was valued at US\$ 175 million in 2024 and is forecast to a readjusted size of USD 314 million by 2031 with a CAGR of 9.1% during review period.

A vacuum linear actuator is a linear drive device that works based on vacuum pressure. It is used to convert vacuum energy into mechanical motion, usually in the form of linear motion. It uses the pressure difference generated by the vacuum system to push the piston or diaphragm inside the actuator to produce linear displacement in a certain direction. Vacuum linear actuators are widely used in occasions that require precise control, high reliability and special operating environments. They are often used in various automation applications such as transmission, operation, and control, especially in vacuum environments or applications that require high cleanliness and low pollution.
