A vascular interventional catheter is a medical device used for diagnosing and treating vascular diseases. It is typically a long, flexible, and steerable tubular device that is inserted into the vascular system through an artery or vein to perform various endovascular procedures. Vascular interventional catheters are widely used in diagnosing cardiovascular diseases, performing angioplasty, embolization, thrombectomy, and stent placement. Physicians use the catheter to guide instruments to the affected area, enabling precise therapeutic interventions to improve blood flow or repair damaged vessels.
