A Viral Transduction Enhancer refers to a substance or method that increases the efficiency with which a virus introduces genetic material into a host cell. In gene therapy and research, viral transduction is a common technique used to deliver therapeutic genes or other genetic elements into cells. Enhancers in this context can include chemical compounds, modifications to the virus, or specific environmental conditions that improve the virus's ability to enter the host cell, thereby increasing the success rate of gene delivery and expression. These enhancers are crucial in optimizing the effectiveness of viral-based gene therapies and related biotechnological applications.
