A Virus Removal Filtration Membrane is a specialized filtration material designed to remove or retain viruses from liquids, ensuring high purity and safety in applications such as biopharmaceutical production, water treatment, and medical processes. These membranes operate based on size exclusion or electrostatic interactions, with pore sizes typically small enough to block viruses while allowing desired molecules to pass through. They are commonly used in the production of vaccines, monoclonal antibodies, and plasma-derived products to ensure the removal of viral contaminants. These membranes provide a reliable, efficient, and scalable solution for maintaining stringent safety and quality standards.
