According to our (Global Info Research) latest study, the global Water Jet Pack market size was valued at US\$ 136 million in 2024 and is forecast to a readjusted size of USD 170 million by 2031 with a CAGR of 3.3% during review period.

The JetLev is a water-propelled jet pack powered through a floater derived from jetski technology attached through an umbilical to the backpack which contains two nozzles and two control arms, in a configuration like traditional rocket belts and gas turbine jet belts.

The Flyboard is a water flying ride from France, invented by Franky Zapata (Frank Zapata) of France. It utilizes the recoil power generated by the water jets on your feet, allowing you to soar above the water. It is also equipped with manually controlled nozzles for stabilizing the airborne attitude. It allows you to dive underwater and leap out of the water like a dolphin, stirring up waves! Others say he moves with the energy of Iron Man! The huge propulsion generated by the jets can produce 100 horsepower and raise the user's ascent to nearly 10 meters to appreciate a new perspective of the coast above all else. The water craft mainly uses mechanics, which is based on the principle of pumping seawater through a huge tube attached to a jet ski, through which the water is then ejected. Watercraft is the use of the principle of water impact, with two huge columns of water will be the top of the air, floating on the surface of the sea as if in the 'fly'. However, this 'floating' looks easy, but in fact, the user needs to mobilize the muscles and ligaments of the whole body to coordinate and balance, for the physical strength has quite strict requirements. The power control of the aircraft is realized by the controller on the jet ski, starting the aircraft requires at least 10 horsepower. Once skilled in the operation of this device, can be realized in the water jumped up to 10 meters high, in the demonstration Zapata was even able to perform a water backflip

action.
