According to our latest research, the global Web Application Vulnerability Scanning Tools market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

A Website Vulnerability Scanner is a tool used to detect and identify security vulnerabilities present in web applications or websites. These vulnerabilities could range from common issues such as SQL injection, cross-site scripting (XSS), insecure server configurations, to more advanced threats like remote code execution. The scanner typically works by simulating various attack scenarios against the target website or web application. It automatically crawls through the site, analyzing the code, forms, inputs, and other elements to identify potential weaknesses. Once vulnerabilities are identified, the scanner generates reports detailing the issues found, along with recommendations for mitigation or remediation. This information helps website owners and administrators to prioritize and address security issues before they are exploited by malicious actors. Some website vulnerability scanners offer additional features such as ongoing monitoring, automatic patching, and integration with other security tools to provide a comprehensive security posture for web applications and websites.
