According to our (Global Info Research) latest study, the global Winged IV Needle market size was valued at US\$ 4332 million in 2024 and is forecast to a readjusted size of USD 6491 million by 2031 with a CAGR of 6.0% during review period.

A Winged IV Needle, also known as a butterfly needle, is a type of intravenous needle that features 'wings' on either side of the needle hub, which help stabilize and control the needle during insertion. These wings allow for more precise placement of the needle, especially when inserting into smaller veins or veins that are difficult to access, such as those in pediatric patients or the elderly. The butterfly design provides enhanced comfort for patients and reduces the risk of needle movement, making it ideal for short-term use in procedures such as blood draws, administering medications, or IV fluid infusion.
