A wired intraoral IOL (Intra-Oral Lens) scanner is a dental imaging device used to capture highly detailed, three-dimensional images of a patient's oral cavity. Unlike traditional impression techniques, which can be uncomfortable and time-consuming, the intraoral scanner allows for quick and precise digital impressions. The 'wired' aspect refers to its connection to a computer or imaging system via a physical cable, ensuring a stable and uninterrupted data transfer during scanning. This technology enhances the accuracy of dental restorations, such as crowns, bridges, and implants, by providing clinicians with exact digital models. The high-resolution images and efficient workflow facilitated by the scanner contribute to improved patient comfort and more precise treatment outcomes.
