SUMMARY

Global Markets Direct's latest Pharmaceutical and Healthcare disease pipeline guide Hypercholesterolemia - Drugs In Development, 2021, provides an overview of the Hypercholesterolemia (Metabolic Disorders) pipeline landscape. Hypercholesterolemia is a condition characterized by very high levels of cholesterol in the blood. This leads in formation of sticky deposits (called plaque) along the artery walls. Plaque can completely block blood flow through an artery, causing heart attack or stroke. Two forms of the condition exist heterozygous familial hypercholesterolemia (HeFH) and homozygous familial hypercholesterolemia (HoFH). Risk factors include obese, family history, high blood pressure, smoking and diabetes. Treatment includes statins, bile acid sequestrants, fibric acid derivatives and cholesterol absorption inhibitors
