SUMMARY

Macrophage Colony Stimulating Factor 1 Receptor (CSF 1 Receptor or Proto Oncogene c Fms or CD115 or CSF1R or EC 2.7.10.1) - Macrophage colony-stimulating factor (M-CSF) is a secreted cytokine which influences hematopoietic stem cells to differentiate into macrophages or other related cell types. It plays an essential role in the regulation of survival, proliferation and differentiation of hematopoietic precursor cells, especially mononuclear phagocytes, such as macrophages and monocytes. It promotes the release of pro-inflammatory chemokines, and thereby plays an important role in innate immunity and in inflammatory processes. It plays an important role in the regulation of osteoclast proliferation and differentiation, the regulation of bone resorption, and is required for normal bone development. It required for normal male and female fertility. It promotes reorganization of the actin cytoskeleton, regulates formation of membrane ruffles, cell adhesion and cell migration.

Macrophage Colony Stimulating Factor 1 Receptor (CSF 1 Receptor or Proto Oncogene c Fms or CD115 or CSF1R or EC 2.7.10.1) pipeline Target constitutes close to 39 molecules. Out of which approximately 36 molecules are developed by companies and remaining by the universities/institutes. The molecules developed by companies in Pre-Registration, Filing rejected/Withdrawn, Phase III, Phase II, Phase I, Preclinical and Discovery stages are 2, 1, 2, 10, 7, 11 and 3 respectively.
