SUMMARY

Global Markets Direct's latest Pharmaceutical and Healthcare disease pipeline guide Non-Hodgkin Lymphoma - Drugs In Development 2022, provides an overview of the Non-Hodgkin Lymphoma (Oncology) pipeline landscape.

Non-Hodgkin lymphoma (also known as non-Hodgkin's lymphoma, NHL, or sometimes just lymphoma) is a cancer that starts in cells called lymphocytes, which are part of the body's immune system. Symptoms depend on what area of the body is affected by the cancer and how fast the cancer is growing. Symptoms may include night sweats (soaking the bed sheets and pajamas even though the room temperature is not too hot), fever and chills that come and go, itching, swollen lymph nodes in the neck, underarms, groin, or other areas, weight loss, coughing or shortness of breath if the cancer affects the thymus gland or lymph nodes in the chest, putting pressure on the windpipe (trachea) or other airway, abdominal pain or swelling, leading to loss of appetite, constipation, nausea, and vomiting and headache, concentration problems, personality changes, or seizures if the cancer affects the brain. Treatment includes surgery, radiation therapy and chemotherapy.
