SUMMARY

Transforming Growth Factor Beta 1 (TGFB1) - Transforming growth factor beta 1 (TGF- β 1) is a polypeptide member of the transforming growth factor beta superfamily of cytokines encoded by the TGFB1 gene. It plays an important role in bone remodeling as it is a potent stimulator of osteoblastic bone formation, causing chemotaxis, proliferation, and differentiation in committed osteoblasts. It promotes either T-helper 17 cells (Th17) or regulatory T-cells (Treg) lineage differentiation in a concentration-dependent manner. It leads to FOXP3-mediated suppression of RORC and down-regulation of IL-17 expression at high concentration. It leads to expression of the IL-17 and IL-23 receptors favoring differentiation to Th17 cells at low concentration.

Transforming Growth Factor Beta 1 (TGFB1) pipeline Target constitutes close to 41 molecules. Out of which approximately 34 molecules are developed by companies and remaining by the universities/institutes. The molecules developed by companies in Phase III, Phase II, Phase I, IND/CTA Filed, Preclinical and Discovery stages are 1, 4, 10, 1, 14 and 4 respectively. Similarly, the universities portfolio in Preclinical and Discovery stages comprises 6 and 1 molecules, respectively. Report covers products from therapy areas Oncology, Gastrointestinal, Musculoskeletal Disorders, Ophthalmology, Respiratory, Genito Urinary System And Sex Hormones, Immunology,
