## **Abstracts**

The global aesthetic exosomes market size was valued at USD 39.7 million in 2025 and is projected to reach USD 139.8 million by 2033, growing at a CAGR of 18.0% from 2026 to 2033. The industry growth is driven by increasing demand for non-invasive, biologically active treatments. Exosomes are nano-sized extracellular vesicles naturally released by cells, playing a key role in cell-to-cell communication and tissue repair.

In aesthetics, they are primarily used for skin rejuvenation, anti-aging, scar reduction, and hair restoration. Unlike traditional cosmetic ingredients, exosomes deliver growth factors, proteins, and genetic material that actively influence skin regeneration processes, positioning them as a next-generation solution in dermatology and cosmetic procedures. One of the primary drivers of market growth is the rising demand for non-invasive and regenerative aesthetic treatments. Consumers are increasingly shifting away from surgical procedures toward minimally invasive solutions that offer faster recovery and natural-looking results. In May 2025, Mayo Clinic highlighted the development of platelet-derived exosomes as a breakthrough in aesthetic medicine, supporting their use as a topical regenerative therapy to improve skin quality and hair health. The innovation focuses on clinically processed, cell-free exosome technology that delivers consistent and measurable biological activity. Clinical observations showed that these exosomes can enhance skin texture, stimulate collagen production, and significantly reduce healing time after aesthetic procedures. This aligns with a broader

industry shift toward “regenerative aesthetics,” where treatments focus on stimulating the body’s own repair mechanisms rather than altering appearance artificially.

Another key growth factor is the strong scientific evidence supporting the benefits of skin rejuvenation. In February 2026, a systematic review published in the National Library of Medicine evaluated the clinical efficacy of exosome-based therapies for skin rejuvenation, analyzing 19 human studies. The study reported that exosome treatments showed promising short-term improvements in skin hydration, elasticity, wrinkles, pigmentation, and overall appearance, with a generally favorable safety profile for topical use. However, the research also highlighted the need for standardized protocols and long-term clinical data to validate widespread aesthetic applications. These outcomes are largely attributed to increased collagen and elastin synthesis, along with reduced oxidative stress in skin cells. Such findings are strengthening clinician confidence and encouraging wider adoption in professional aesthetic practices.

Exosomes improve multiple skin concerns, such as fine lines, pigmentation, and laxity, in a single treatment. They support natural repair processes, aligning with demand for subtle, non-surgical rejuvenation.

A further important driver is the growing consumer awareness and demand for anti-aging solutions. Exosomes have gained attention for their ability to target multiple skin concerns simultaneously, including fine lines, pigmentation, inflammation, and texture. The key market players are continuously focusing on developing new products to fulfill the market demand. For instance, in December 2025, Le-Vel announced the launch of its XERA exosome-powered skincare system, incorporating advanced engineered exosome technology to enhance skin repair, regeneration, and anti-aging performance. The system is designed to activate the skin’s natural healing processes through biomimetic signaling, representing a shift toward lab-developed regenerative skincare solutions. This launch highlights the growing commercialization of synthetic and engineered exosome-based cosmetic platforms.

In addition, increasing use in adjunct aesthetic procedures and availability of innovative & advanced exosome-based aesthetic products are further accelerating market expansion. For instance, in June 2025, PYFAESTHETIC announced the launch of its synthetic small extracellular vesicle (sEV)-based skincare product, NEOFOUND BIOS, at AMUSE 2025, marking a significant advancement in exosome-inspired aesthetics. The product utilizes lab-engineered exosome-like vesicles combined with biomimetic actives to enhance skin regeneration, improve texture, and support collagen and elastin

production. This launch highlights the industry shift toward synthetic, non-biological exosome technologies offering improved stability, safety, and scalability for aesthetic applications.

Moreover, Exosomes are widely used alongside treatments such as microneedling, laser resurfacing, and chemical peels to enhance outcomes and reduce downtime. Clinical insights suggest that their application post-procedure improves recovery speed and treatment efficacy by promoting faster tissue repair. This complementary role is encouraging dermatologists and aesthetic practitioners to integrate exosomes into standard treatment protocols, thereby increasing procedural demand and product consumption.
