## Abstracts

The global antibody optimization service market size was estimated at USD 1.36 billion in 2024 and is projected to reach USD 2.87 billion by 2033, growing at a CAGR of 8.81% from 2025 to 2033. The growth is primarily driven by the increase in demand for next-generation therapeutic antibodies, rising investments in biologics research and development, and advancements in computational modeling and protein engineering platforms.

Rising prevalence of complex diseases

The increasing occurrence of complex and chronic illnesses, such as cancer, autoimmune diseases, neurodegenerative diseases, and emerging infectious diseases, is spurring demand for the optimization of antibody services. As patient populations increase and diseases become more heterogeneous, the need for highly targeted, effective biologics that hit specific molecular pathways becomes evident. Monoclonal antibodies and next-generation therapeutic formats have become highly utilized due to their specificity and lower systemic toxicity. To achieve the best possible therapeutic performance, monoclonal and other next-generation proteins must be optimized for the selective enhancement of affinity, stability, specificity, and immunogenicity. This has intensified the demand for specialized optimization platforms and the capability to satisfy the complex needs of contemporary drug development programs.

Moreover, the increasing presence of new pathogens and newly evolving viral variants, in the context of worldwide infectious disease concerns, has pushed the development of rapid and scalable antibodies to the forefront. Optimization of antibodies is crucial for increasing neutralization potency, enhancing therapeutic efficacy, and scaling up production for pandemic preparedness and response. Accordingly, the increasing burden of complex disease expands the therapeutic antibody pipeline and strengthens the rationale for optimization services to develop next-generation clinically relevant biologics.
