## Abstracts

The global antihyperlipidemic drugs market size was valued at USD 14.3 billion in 2025 and is projected to grow from USD 15.0 billion in 2026 to USD 22.0 billion by 2033, at a CAGR of 5.6% from 2026 to 2033. North America dominated the market, accounting for the largest revenue share of 41.2% in 2025. The market is supported by the ongoing need to manage elevated LDL cholesterol and triglyceride levels and to reduce the risk of cardiovascular disease.

Statins remain the main treatment option because of their established use, availability of generic products, and role in long-term cholesterol management. However, treatment is expanding beyond statins as patients with cardiovascular risk may require additional LDL-lowering therapies such as ezetimibe, bempedoic acid, PCSK9 inhibitors, and inclisiran. The market also includes therapies for high triglyceride levels, including fibrates and prescription omega-3 products. Growing focus on lipid testing, earlier treatment, and management of patients who do not achieve adequate lipid control with statins is supporting demand for combination and non-statin therapies. Treatment decisions are increasingly based on overall cardiovascular risk, LDL-C levels, and patient-specific factors, supporting continued use of both established and newer antihyperlipidemic drugs.
