Abstracts

The global benign positional vertigo market size was estimated at USD 1.84 billion in 2024 and is projected to reach USD 2.73 billion by 2033, growing at a CAGR of 4.5% from 2025 to 2033. The benign positional vertigo industry is driven by the growing prevalence of vestibular disorders, increased awareness of balance-related conditions, and advancements in diagnostic tools such as videonystagmography (VNG) and magnetic resonance imaging (MRI).

Rising geriatric population prone to inner ear dysfunctions further supports market growth. Expanding use of vestibular rehabilitation therapy and pharmacological treatments, including antihistamines and vestibular suppressants, is contributing to demand. In addition, increasing research on vestibular dysfunction mechanisms is expected to enhance treatment accessibility and adoption.

The rise in vestibular disorders and the growing elderly population drive demand for effective treatment options for benign positional vertigo across a wide patient base. Advances in diagnostic tools, non-invasive therapies, and guided repositioning devices have improved accuracy, patient comfort, and clinical outcomes. Vestibular impairments occur frequently with age, creating a substantial population at risk. According to an article published in the International Journal of Otorhinolaryngology and Head and Neck Surgery in July 2023, the overall prevalence of age-related vestibular loss was reported to be 35.4% among individuals aged over 40 years, highlighting the substantial patient pool requiring targeted interventions.
