## **Abstracts**

The global conical dental implant market size was estimated at USD 3.89 billion in 2025 and is projected to reach USD 7.67 billion by 2033, growing at a CAGR of 8.98% from 2026 to 2033. The market is growing due to increasing demand for reliable, long-lasting, and aesthetically advanced tooth-replacement solutions.

The rising prevalence of periodontal disease and tooth loss is a major factor contributing to market expansion, as more patients seek effective restorative treatments. Conical implants are gaining strong preference among dental professionals due to their tapered design, which provides enhanced primary stability, improved load distribution, and better sealing, reducing the risk of complications. In addition, the growing adoption of cosmetic dentistry and patients' inclination toward natural-looking outcomes are further supporting the growth of the conical dental implant industry.

The rising prevalence of periodontal disease is the driving growth of the conical dental implant market, as it remains a leading cause of tooth loss globally. As the incidence of periodontal disease continues to increase, particularly in aging populations and individuals with chronic conditions, the number of patients experiencing tooth loss is also rising. This directly increases demand for effective, long-term restorative solutions, such as dental implants. According to the WHO, in March 2025, the estimated global average prevalence of complete tooth loss is almost 7% among people aged 20 years

or older. For people aged 60 years or older, a much higher global prevalence of 23% has been estimated.

The number of tooth extractions is growing in the conical dental implant industry. The increasing prevalence of dental caries, periodontal diseases, trauma-related tooth loss, and aging populations has led to a higher volume of extractions globally. As patients and clinicians prefer permanent, aesthetically superior solutions over removable dentures or bridges, conical dental implants are gaining traction for their stability, enhanced primary fixation, and suitability for immediate placement following extraction. Their tapered design closely mimics the natural tooth root, enabling better adaptation to extraction sockets and preserving bone structure. The graph below shows the number of tooth extraction episodes in the UK between 2021 and 2025.

Conical dental implants are preferred in such cases due to their tapered design, which provides superior stability and better performance in compromised bone conditions often associated with periodontal disease. In addition, their ability to reduce bacterial infiltration makes them well-suited for patients with a history of gum disease. The growing burden of periodontal disease is directly driving the adoption of conical dental implants, thereby accelerating overall market growth.
