Connected Drug Delivery Devices Market Growth & Trends

The global connected drug delivery devices market size is expected to reach USD 25.63 billion by 2030, according to a new report by Grand View Research, Inc. The market is expected to expand at a lucrative CAGR of 23.45% from 2023 to 2030. Key factors driving the market growth include the need to increase patient medication adherence, R&D initiatives, and the acceleration of remote digital monitoring. In September 2022, Ypsomed for instance, partnered with Sidekick Health to expand Ypsomed's device and SmartServices offering by incorporating a self-injection module into Sidekick's known digital therapeutics solution. Through this, patients with chronic diseases are likely to receive a personalized patient experience due to the integration of Ypsomed's devices with Sidekick's digital health behavioral economics and gamification expertise, and pharmaceutical customers will benefit from a comprehensive service, and leading digital therapy management system.

One of the technological advancements is connected drug delivery, which has a sensor that enables communication and data transfer to servers and apps over cellular, Bluetooth, and Near Field Communication (NFC) networks. One of the main benefits of

these connected drug delivery systems is that it gives patients reminders and adherence trackers, reducing the effort needed to comply with the prescribed medication schedule. This further reduces the cost of prescription waste, especially that from the increasingly popular biological injectable drugs that insurance would be required to pay for. Additionally, doctors can monitor how well their patients are adhering to their recommended therapies owing to connected drug delivery systems and change the patient's care as appropriate. For instance, connected drug delivery devices can be beneficial to manage self-medication in persons with chronic diseases like diabetes and asthma. In the upcoming years, these factors are anticipated to accelerate market growth.

Worldwide rising rates of chronic illnesses like COPD, diabetes, and asthma are anticipated to propel the business of connected drug delivery devices. For instance, according to research on estimates of diabetes prevalence for 2021 that was published in January 2022 by the National Library of Medicine and National Center for Biotechnology Information, the disease prevalence among people aged 20 to 79 in 2021 was estimated to be 10.5% and could increase to 12.2% by 2045. Diabetes is thought to affect both men and women equally, however, it is most common in people aged 75 to 79. Additionally, as connected drug delivery devices with greater advantages have become more popular, manual drug administration devices have been increasingly replaced. These factors are anticipated to fuel connected drug market growth.

The global COVID-19 pandemic has had a negative impact and raised the need for healthcare services. This has accelerated the trend of redesigning the healthcare system for improved assistance and quick growth of technology. While most global markets went down in 2020, this market showed unprecedented growth despite difficult conditions and a lockdown in most countries. Due to the lockdown restrictions, there was an unexpected rise in demand for drug delivery systems for use in-home care, which resulted in an increase in demand for connected drug delivery devices.

The report "Connected Drug Delivery Devices Market Size, Share & Trends Analysis Report, By Product (Connected Sensors, Integrated Connected Devices), By Route of Administration (Parenteral, Inhalational), By Application (Asthma, COPD, Diabetes Management), By Region, And Segment Forecasts, 2022-2030" is available now to Grand View Research customers and can also be directly purchased from
