## Abstracts

The global dasatinib market size was estimated at USD 5.59 billion in 2025 and is projected to reach USD 7.57 billion by 2033, growing at a CAGR of 4.27% from 2026 to 2033. The global dasatinib market is expanding due to the rising prevalence of hematologic malignancies, particularly chronic myeloid leukemia and Philadelphia chromosome positive acute lymphoblastic leukemia.

Increasing awareness of targeted oncology therapies has improved diagnosis and early treatment initiation across developed and emerging regions. Physicians prefer tyrosine kinase inhibitors for sustained disease control, supporting long term demand. Longer survival has increased cumulative drug utilization, strengthening revenue visibility. For instance, November 2025, OncLive reported FDA approval of a generic dasatinib abbreviated new drug application in six strengths, 20 mg, 50 mg, 70 mg, 80 mg, 100 mg, and 140 mg. Initial clearance occurred in 2006, with expansion in January 2019 based on a phase 2 trial in 78 pediatric patients showing 64.1 percent 3 year event free survival, 95 percent confidence interval 52.4 percent to 74.7 percent, 96 percent below 5 percent marrow blasts at induction, 97 percent at consolidation, 4 percent fatal adverse effects among 81 patients, and 10 percent discontinuation.

Advancements in precision medicine and molecular diagnostics have strengthened biomarker driven therapy selection, accelerating adoption of targeted treatments such

as dasatinib. Clinical evidence in resistant or intolerant chronic myeloid leukemia has reinforced physician confidence and supported guideline recommendations for second generation tyrosine kinase inhibitors. For instance, January 2026, Cancer Reports published a retrospective analysis of 53 adults treated with low dose dasatinib 50 mg daily between 2002 and 2025, with a median age of 50 years. Molecular response outcomes included 41.5 percent achieving MR4.5, 20.8 percent MR4.0, and 15.1 percent major molecular response without deep response. Tyrosine kinase domain mutations were present in 32.1 percent, clinically significant adverse events in 49.1 percent, 22.6 percent required switching for inadequate response, and 7.5 percent for intolerance. Baseline BCR ABL1 greater than or equal to 100 percent, T315I mutation, and high ELTS risk predicted poorer outcomes.
