Abstracts

The global dental crown remover market size was valued at USD 73.2 million in 2025 and is projected to grow from USD 75.5 million in 2026 to USD 99.3 million by 2033, at a CAGR of 4.0% from 2026 to 2033. North America held the largest revenue share of 35.4% in 2025. The growth of the dental crown remover industry is driven by the increasing number of dental crown restorative and replacement procedures performed globally.

As more patients receive dental crowns for the treatment of tooth decay, fractures, and cosmetic corrections, the need to safely remove and replace existing crowns is also rising. Dental crowns are widely used to restore damaged, decayed, or weakened teeth and are among the most common restorative treatments in modern dentistry. Although crowns are designed to be durable, they are not permanent and typically have a lifespan of 5 to 15 years, depending on factors such as oral hygiene, material type, chewing habits, and overall dental health. Over time, crowns may become worn, fractured, loose, or damaged due to normal usage and mechanical stress. In addition, issues such as marginal leakage, secondary tooth decay beneath the crown, gum recession, or poor fit can compromise the effectiveness of an existing restoration. Growing demand for aesthetic dentistry is also prompting many patients to replace older metal crowns with newer ceramic or zirconia alternatives that offer improved appearance and functionality.

In addition, this growth is driven by the expansion of cost-effective dental care services and the rising popularity of dental tourism, particularly in countries offering affordable restorative and prosthetic dental treatments. Patients traveling for procedures such as dental restorations, implant-supported crowns, and full-mouth rehabilitation often require the removal of existing or damaged crowns before new restorations can be placed. In countries such as India, where dental treatment costs are significantly lower than in developed nations, the increasing influx of international patients is driving the volume of restorative dental procedures. As a result, dental clinics and hospitals are investing in efficient crown removal instruments to ensure safe, quick, and minimally invasive crown removal while preserving the underlying tooth structure. The growing number of restorative procedures and crown replacement associated with dental tourism is therefore contributing to the rising demand for dental crown removers across dental practices.
