Abstracts

The global dental regeneration market size was estimated at USD 5.82 billion in 2025 and is projected to reach USD 9.59 billion by 2033, growing at a CAGR of 6.51% from 2026 to 2033. The market growth is primarily driven by the rising prevalence of periodontal diseases and tooth loss, as well as the increasing demand for dental implants.

The growing preference for minimally invasive, tissue-preserving treatments further supports the adoption of regenerative biomaterials and biologics. In addition, advancements in bone graft substitutes, membranes, and growth factor-based therapies are enhancing clinical outcomes and expanding treatment applications.

The rising prevalence of periodontal disease, dental caries, and tooth loss significantly drives the dental regenerative market by increasing the need for tissue restoration procedures. Advanced gum disease often leads to destruction of alveolar bone and soft tissue, creating demand for bone grafts, membranes, and biologic regeneration products. As more patients seek to preserve natural teeth and support dental implants, regenerative therapies become essential. This growing disease burden directly expands the patient pool requiring advanced regenerative solutions.

The shift toward biological and minimally invasive dentistry drives the dental regenerative industry by increasing demand for therapies that preserve and restore natural tissues rather than replace them. Clinicians are adopting bioactive materials,

growth factors, and regenerative techniques that promote natural healing with less surgical trauma. This treatment philosophy aligns with patient preferences for conservative, long-term solutions, thereby accelerating the adoption of regenerative products and technologies.
