### **Dermatology Excimer Laser Market Growth & Trends**

The global dermatology excimer laser market size is expected to reach USD 955.5 million by 2028, according to a new report by Grand View Research, Inc., registering a CAGR of 10.0% over the forecast period. Dermatology excimer lasers are a novel form of targeted phototherapy that delivers a specific wavelength (308 nm) of monochromatic UVB radiation using an excimer laser or an excimer lamp. According to NCBI, excimer lasers have been proven effective in treating skin conditions like psoriasis, vitiligo, atopic dermatitis, alopecia area ta, allergic rhinitis, folliculitis, etc.

Factors like the rising prevalence of skin conditions, such as eczema, the non-invasive nature of the procedures, and the advent of technologically advanced treatment systems, offering lower complication risks, are expected to propel market growth. Skin conditions that are generally considered difficult to treat, such as hypopigmented striae and hypopigmented scars, can also be effectively treated using excimers. Technological advancement and availability of an extensive range of devices in the market that offers high patient satisfaction and visible results are expected to boost the market growth.

The global market was adversely affected due to the COVID-19 pandemic as the footfall of patient appointments for skin treatments was temporarily suspended. However, the

governments in many countries have allowed dermatology clinics to resume skin treatment consultations and aesthetic procedures by adhering to strict COVID-19 protocols. Moreover, many aesthetic professionals believe that there will be a surge in demand for beauty and aesthetic treatments post-COVID-19 crisis, which is expected to propel market growth.

### Dermatology Excimer Laser Market Report Highlights
