### Healthcare Command Centers Market Summary

The global healthcare command centers market size was estimated at USD 1.84 billion in 2024 and is projected to reach USD 4.55 billion by 2033, growing at a CAGR of 10.7% from 2025 to 2033. Growing adoption of virtual care and hospital-at-home programs is one of the factors driving the market growth.

As healthcare systems shift toward decentralized care, the need for centralized coordination is rising. Command centers are becoming essential for managing hospital-at-home initiatives, where patients receive acute-level care at home supported by remote monitoring and on-demand clinical interventions. These centers act as the “nerve center,” coordinating between virtual clinicians, home health providers, and logistics teams, ensuring safety while scaling care beyond hospital walls.

For instance, in August 2024, the Mayo Clinic expanded its Advanced Care at Home program with a dedicated command center in Jacksonville, Florida. From this hub, physicians and nurses provide 24/7 virtual monitoring, coordinate diagnostics, and dispatch in-home clinical teams when needed. The command center has been pivotal in reducing inpatient admissions for patients who can be safely treated at home, while still maintaining hospital-grade oversight and safety standards.

The increasing pressure to optimize patient flow drives the market growth. Hospitals worldwide are dealing with overcrowded emergency departments, delayed discharges, and shortages of critical care beds. Command centers directly address this challenge by acting as a central hub where clinical and operational staff monitor admissions, transfers, and discharges in real time. Using advanced dashboards, hospitals can anticipate bottlenecks and proactively reallocate resources to maintain steady patient flow.

For instance, in October 2024, the Cleveland Clinic unveiled an expanded Command Center at its main campus in Ohio. The facility integrates live feeds from electronic health records, bed-tracking systems, and patient transfer data to reduce emergency department boarding times and ensure ICU capacity is managed efficiently. The system allowed care teams to identify delays in discharges earlier in the day, leading to smoother patient transitions and faster bed turnover.

Case: Providence Puget Sound is an 8-hospital, 2,400-bed system in the Pacific Northwest (USA). The system had uneven capacity: hospitals in some regions (Central) were consistently over-burdened, while others (North/South) had excess capacity. There was limited visibility across the hospitals, causing transfer delays, ED boarding, and inefficient utilization of beds. Published in November 2024.
