Abstracts

The global helium-free MRI systems market size was valued at USD 1.7 billion in 2025 and is projected to grow from USD 1.8 billion in 2026 to USD 3.3 billion by 2033, at a CAGR of 8.9% from 2026 to 2033. North America dominated the market, accounting for a revenue share of 41.3% in 2025. Growing demand for improved diagnostic imaging technologies, growing concerns regarding helium supply restrictions, and the need to reduce MRI installation and maintenance costs. By implementing sealed-magnet technology, healthcare providers can eliminate their need for liquid helium refills, streamline infrastructure, and improve operational efficiency.

One promising area is the development of cryogen-free superconducting magnets, which use alternative cooling approaches to maintain the temperatures required for superconductivity without relying on conventional liquid-helium cooling. These systems can reduce dependence on helium supply chains and may simplify certain installation and maintenance requirements. However, cryogen-free magnet technologies should be distinguished from sealed-magnet MRI systems that retain a small quantity of helium in a closed circuit.

A research paper was published in September 2025 in IEEE Transactions on Applied Superconductivity. The paper was entitled “Development of a Helium-Free 1.5 T Extremity MRI Magnet.” Researchers present the design, construction and testing of a 1.5T superconducting magnet cooled purely by conduction, without liquid helium. The magnet generated a 1.5T field strength and had a magnetic field homogeneity

appropriate for the development of extremities MRI. These studies show the promise of a small, helium-free MRI system for targeted anatomy, but more system-level testing and clinical evaluation are required before any claims can be made about commercial viability.
