Abstracts

The global hyperhidrosis treatment market size was valued at USD 1.7 billion in 2025 and is projected to grow from USD 1.8 billion in 2026 to USD 3.2 billion by 2033, at a CAGR of 8.4% from 2026 to 2033. North America dominated the market, accounting for the largest revenue share of 41.3% in 2025. The industry is driven by the need to manage excessive sweating affecting areas such as the underarms, palms, feet, and face.

Hyperhidrosis can interfere with daily activities, personal interactions, work performance, and quality of life, creating a need for effective and convenient treatment options. The market includes prescription antiperspirants, topical anticholinergic products, iontophoresis, botulinum toxin injections, oral medications, energy-based treatments, and surgical procedures. Treatment selection varies based on the affected body area, symptom severity, treatment response, and patient preference. Topical therapies have gained attention as non-invasive options, particularly for axillary hyperhidrosis, while procedural treatments continue to be used for patients who require longer-lasting symptom control. The market is also supported by improving recognition of hyperhidrosis as a medical condition rather than only a cosmetic concern. However, delayed diagnosis and limited patient awareness remain barriers to access to treatment. Overall, the market continues to develop through broader treatment availability and growing clinical attention.
