Human Embryonic Stem Cells Market Growth & Trends

The global human embryonic stem cells market size is expected to reach USD 4.08 billion by 2030, registering to grow at a CAGR of 10.5% from 2024 to 2030 according to a new report by Grand View Research, Inc. Application of hESCs as a promising donor source for cellular transplantation therapies is anticipated to bolster progress through to 2025. hESCs technology tends to be useful for tissue engineering in humans due to high histocompatibility between host and graft.

Maintenance of developmental potential for contribution of derivatives of all three germ layers is an important feature of these cells. This ability remains consistent even after clonal derivation or prolonged undifferentiated proliferation, thus pronouncing its accelerated uptake.

In addition, these are capable in expressing high level of alkaline phosphatase, key transcription factors, and telomerase. These factors are found to be of great importance in the maintenance of the inner cellular mass pluripotency.

Furthermore, hESCs can be easily differentiated into defined neurons, neural lineages, oligodendrocytes, and astrocytes. Aforementioned characteristic makes it useful in

studying the sequence of events that take place during early neurodevelopment.

However, use of stem cells derived from viable embryos is fraught with ethical issues, prompting scientists to explore other methods to generate ESCs. The other methods include derivation of embryonic germ cells, stem cells from dead embryos, and other techniques.

Human Embryonic Stem Cells Market Report Highlights

Regenerative medicines dominated the market with a share of 61.1% in 2023. Regenerative medicines offer significant advancements in treating several diseases. Moreover, pluripotent cells originating from human embryos have been central to biomedical research.
