Abstracts

The global implantable tibial neuromodulation market size was estimated at USD 54.46 million in 2025 and is projected to reach USD 87.37 million by 2033, growing at a CAGR of 6.88% from 2026 to 2033. The market is driven by the rising prevalence of conditions such as overactive bladder and urinary incontinence, particularly among the aging population.

The increasing preference for minimally invasive, long-term treatment solutions over conventional therapies, along with technological advancements in neuromodulation devices, is further supporting market growth. In addition, growing awareness and improved access to urological care are accelerating adoption rates globally.

The increasing prevalence of bladder disorders such as overactive bladder and urinary incontinence is a key driver of the implantable tibial neuromodulation industry, as these conditions require effective long-term management solutions. As patient numbers rise globally, demand for minimally invasive, durable therapies is increasing. This trend is accelerating the adoption of implantable neuromodulation devices that offer improved symptom control and quality of life. According to the National Center for Biotechnology Information, in August 2024, the prevalence of urinary incontinence in men was approximately half that observed in women. It was estimated that 11% to 34% of older men experience urinary incontinence, with 2% to 11% reporting daily symptoms, while the risk is notably higher among individuals undergoing prostate surgery.
