Abstracts

The global intraoral X-ray market size was estimated at USD 1.89 billion in 2025 and is projected to reach USD 2.95 billion by 2033, growing at a CAGR of 5.62% from 2026 to 2033. The intraoral X-ray market is driven by the increasing prevalence of dental caries, periodontal diseases, and endodontic conditions, requiring precise diagnostic imaging.

Rising adoption of digital dentistry, including CMOS/CCD sensors and PSP systems, is improving image quality and reducing radiation exposure. Growing demand for minimally invasive and preventive dental care, expansion of dental clinics and diagnostic centers, and integration of AI-enabled imaging software further support market growth across developed and emerging regions.

The growing prevalence of dental disorders, including tooth decay, tooth loss, and tooth extraction, is a key driver of the intraoral X-ray market. According to the World Health Organization, published in March 2025, nearly 7% of adults aged 20+ and around 23% of those aged 60+ experience complete tooth loss, increasing the need for implants. A report by Humble Memorial Dental published in February 2025 states that 3.5 billion individuals suffer from oral diseases globally, with cavities affecting over 90% of adults and gum disease impacting nearly half of those aged 30 and above. This rising disease burden, such as tooth loss, cavities, and gum disease, is anticipated to significantly increase the demand for intraoral diagnostic imaging for early detection, treatment planning, and post-procedural monitoring.

The graph indicates that tooth decay and missing teeth are prevalent among adults in Australia, increasing the need for intraoral X-ray imaging to support diagnosis, treatment planning, and restorative decision-making, including implant evaluation. In addition, the high incidence of caries and orthodontic conditions among children and adolescents necessitates frequent intraoral radiographic imaging for early diagnosis and treatment monitoring. Dental implant placement is generally considered after skeletal growth completion, typically around 15 years for girls and 17-18 years for boys, further supporting imaging requirements in late adolescence and adulthood.

Moreover, according to data published by the UK Government, NHS hospitals in England recorded 49,112 tooth extraction episodes among individuals aged 0 to 19 in the financial year ending 2024, representing a 3% increase compared to the previous year. This rising trend in tooth extractions underscores the growing need for intraoral X-ray imaging to support accurate diagnosis, pre-extraction assessment, treatment planning, and post-extraction restorative decision-making.
