Abstracts

The global oncology drugs market size was valued at USD 257.6 billion in 2025 and is projected to grow from USD 280.7 billion in 2026 to USD 541.6 billion by 2033, at a CAGR of 9.8% from 2026 to 2033. North America dominated the market, accounting for the largest revenue share of 41.2% in 2025. The market is expanding due to the rising global burden of cancer, increasing adoption of precision medicine, and continued investment in innovative therapies.

Growing use of immunotherapies, targeted therapies, and cell-based treatments is improving clinical outcomes across multiple tumor types and supporting market growth. Advances in biomarker testing and genomic profiling are enabling more personalized treatment approaches, while faster regulatory pathways for therapies addressing unmet medical needs are accelerating product launches. Expanding healthcare expenditure and improving access to cancer diagnosis and treatment in emerging economies are further supporting demand.

However, high treatment costs, reimbursement challenges, and pricing pressure from generic and biosimilar products continue to influence market performance. Complex clinical development processes and stringent regulatory requirements also affect the pace of commercialization. Despite these challenges, ongoing research collaborations, an increasing number of oncology clinical trials, and broader integration of companion

diagnostics are expected to strengthen the development pipeline and create opportunities for sustained market expansion in both developed and emerging healthcare markets.
