Peripheral Artery Disease Market Summary

The global peripheral artery disease market size was estimated at USD 7.3 billion in 2024 and is projected to reach USD 11.3 billion by 2033, growing at a CAGR of 5.2% from 2025 to 2033. The intersecting forces of rising disease burden, continuous technological advancement, and demographic aging drive the peripheral artery disease (PAD) industry.

This alignment of unmet clinical needs with evolving therapeutic capabilities accelerates demand across care settings. The growing prevalence of diabetes and tobacco use remains a foundational force driving the market. Both risk factors contribute directly to the progression of atherosclerosis, the core pathological mechanism behind PAD. With diabetes rates climbing globally-particularly in aging, urban populations-and smoking still widespread in lower-income countries, the incidence of PAD continues to rise.

In March 2025, an Intermountain Health study presented at the ACC conference revealed that only 29.6% of women and 33.5% of men with symptomatic peripheral artery disease received full guideline-directed therapy. Among 7,522 patients tracked, the mortality rate exceeded 50%, underscoring severe gaps in diagnosis and treatment. Despite similar referral rates, women were less likely to receive optimal care. The study

emphasized the need for improved screening protocols and focused PAD management.

Rapid innovation in endovascular technologies is reshaping treatment strategies and reinforcing market momentum. Next-generation tools such as drug-coated balloons, atherectomy systems, and bioresorbable stents offer improved efficacy, fewer complications, and shorter recovery times. These solutions are increasingly favored for treating complex lesions precisely while reducing restenosis and the need for repeat interventions. In March 2025, a study in *Scientific Reports* introduced DBMedDet, a deep-learning model that improved stent placement accuracy during endovascular procedures. With high precision (mAP 0.841) and real-time detection (127 FPS), it outperformed YOLO models in identifying stent boundaries across coronary, peripheral, and cerebrovascular cases.

Population aging further amplifies the market potential for PAD interventions, with individuals over 65 facing significantly elevated risk. Age-related arterial stiffening and the accumulation of comorbidities make this demographic especially vulnerable. In March 2025, the *Aging Journal* published findings from the Long Life Family Study showing individuals from long-lived families have a significantly lower risk of PAD. PAD prevalence among offspring of these families was only 1%, versus an expected 12%. Researchers linked this to protective genetic traits and healthier vascular profiles, identifying four genomic regions potentially tied to PAD resistance.
