Abstracts

The global preformed crowns market size was estimated at USD 1.29 billion in 2025 and is projected to reach USD 2.19 billion by 2033, growing at a CAGR of 6.9% from 2026 to 2033. The market growth is driven by the rising prevalence of dental caries and early childhood tooth decay, increasing demand for minimally invasive restorative procedures, and expanding awareness of pediatric and restorative dental care.

In addition, growing adoption of advanced dental materials such as stainless steel, polycarbonate, and resin-based crowns, along with improvements in chairside dental techniques, is supporting market expansion. The high burden of untreated dental caries in primary teeth, especially among children. Dental decay remains one of the most common chronic conditions worldwide, leading to a strong need for reliable restorative solutions such as preformed crowns. For instance, in August 2025, the World Health Organizations (WHO) reported that dental caries remain the most common noncommunicable disease (NCD) globally, affecting about 2.5 billion people. It is largely preventable but continues to create a significant health and economic burden worldwide.

High consumption of free sugars in food and beverages is the key risk factor driving the disease. WHO recommends limiting sugar intake to below 10% of total energy, ideally under 5%, to reduce risk. It also supports policies such as sugar-sweetened beverage

taxation and early-life sugar restrictions to improve oral health outcomes. This growing disease burden is therefore increasing the demand for effective preventive and restorative dental solutions, including preformed crowns, to manage decay in primary teeth and improve long-term oral health outcomes.
