Unit Dose Manufacturing Market Growth & Trends

The global unit dose manufacturing market size is expected to reach USD 61.5 billion by 2028, according to a new report by Grand View Research, Inc. It is expected to expand at a CAGR of 18.2% from 2021 to 2028. In the first half of 2020, the growth of the market was stagnant, but the market started to recover by the end of 2020. It was mainly due to the use of unit doses for the treatment of COVID-19 as it decreases the risk involved while handling and pouring doses from the same bottle.

Unit dose manufacturing has many advantages as the drug can be easily identified, and the formulation of the drug is protected until the moment of administration. If the container is intact and the drug has not been used, it can be redispensed and retrieved without changing its formulation. The most important benefit is that it can be administered in the proper dosage and ensures that the patient does not exceed the prescribed limit.

However, the COVID-19 pandemic has a significant effect on the pharmaceutical market. The first half of the COVID-19 pandemic had slowed growth but by the end of 2020, the market started to recover. The unit dose manufacturing is lucratively used in the current scenario as it reduces the risk of handling and contamination. Also, unit

doses are widely used in hospitals for COVID-19 patients to safeguard both patients and healthcare personnel to eliminate the possibility of viral transmission by airborne transmission or direct touch.
