Abstracts

The global zero waste mining market size was valued at USD 8.6 billion in 2025 and is projected to grow from USD 9.4 billion to USD 18.4 billion by 2033, at a CAGR of 10.1% from 2026 to 2033. Asia Pacific dominated the market, accounting for the largest revenue share of 38.9% in 2025. Zero waste mining is a sustainable mining approach that aims to maximize the recovery and utilization of all extracted materials while minimizing or eliminating waste generation throughout the mining lifecycle.

The zero waste mining industry is experiencing strong growth as mining companies face increasing pressure to maximize resource utilization while minimizing environmental impacts. Declining ore grades, rising extraction costs, and the growing demand for critical minerals have made it economically attractive to recover additional value from waste streams such as tailings, waste rock, slag, and process residues.

Advanced mineral processing technologies, ore sorting systems, and metal recovery solutions enable operators to extract previously unrecoverable minerals, improving overall resource efficiency and extending the life of existing mining assets. This combination of economic and operational benefits is encouraging mining companies to adopt zero waste mining strategies across both new and existing operations.
