SUMMARY

A liquid crystal display, which is the most typical kind of flat panel display (FPD), consists of two sheets of glass (8th generation substrates are 2,200 x 2,500 mm in size) separated by a 5 μm gap containing liquid crystals (solid or liquid intermediate material with crystalline properties) through which an image can be projected by applying an electric current to the liquid crystals to control the passage of light. This technology takes advantage of the properties of liquid crystals that enable them to both maintain the same orientation with respect to each other and change orientation when a voltage is applied. A large part of the process of creating a liquid crystal display is the formation of the circuits on the glass substrate.
