SUMMARY

Hydrotreating, formally known as hydrodesulfurization (HDS), is a chemical process used on natural gas and refined petroleum. The aim of this process is to decrease the amount of sulfur in the petroleum by increasing the amount of hydrogen in the product. This is done for a variety of reasons, such as decreasing the environment impact when these petroleum products are used, and to keep the reforming units that process the petroleum from being poisoned. Most of the sulfur produced annually comes from this process.
