SUMMARY

Methylene blue was originally synthesized in 1876 as an aniline-based dye for the textile industry, but scientists such as Robert Koch and Paul Ehrlich were quick to realize its potential for use in microscopy stains. The observation of selective staining and inactivation of microbial species led to the testing of aniline-based dyes against tropical diseases. Methylene blue was the first such compound to be administered to humans, and was shown to be effective in the treatment of malaria. Methylene blue was also the first synthetic compound ever used as an antiseptic in clinical therapy, and the first antiseptic dye to be used therapeutically.
