SUMMARY

A gas spring is a type of spring that, unlike a typical metal spring, uses a compressed gas, contained in a cylinder and compressed by a piston, to exert a force. A gas spring in compression is similar to a coil spring but normally much flatter. Compression gas springs have the rod out and the load from the application forces the rod in. Typically mounted so they are rod down in the position in which they spend the most time. This allows the oil contained within gas spring to lubricate the rod seals. By varying the design of the piston, seals and bearings and by modifying the quantity and viscosity or the lubricating oil can provide gas springs with different operating characteristics.
