SUMMARY

Ablation Technologies is the treatment that destroys tumors or unwanted material without affecting other body tissues or organs. Because of poor health or reduced organ function, these techniques are widely used to treat cancer, cardiovascular and other chronic diseases. In the treatment of chronic diseases, medical ablation plays the prime role in the removal or complete destruction of abnormal tissue. Medical ablation can be done without surgery by insertion of the probe or a needle through the skin into the tumor. Ablation refers to a minimally invasive surgical procedure for the destruction or removal of abnormal tissues that can cause life-threatening conditions such as cancer, atrial fibrillation, and others. The most common types of cancers treated by medical ablation are kidney (renal) cancer, liver cancer, and lung cancer.
