SUMMARY

Activated carbon, also called activated charcoal, activated coal, or carbon activates, is a form of carbon processed to have small, low-volume pores that increase the surface area available for adsorption or chemical reactions. Activated is sometimes substituted with active. Due to its high degree of micro porosity, just one gram of activated carbon has a surface area in excess of 500 m², as determined by gas adsorption. An activation level sufficient for useful application may be attained solely from high surface area; however, further chemical treatment often enhances adsorption properties. Activated charcoal is considered to be the most effective single agent available. Activated carbon is usually derived from charcoal and increasingly, high-porosity bio char.

The global Activated Carbon market will reach xxx Million USD in 2020 with CAGR xx% 2020-2025. The main contents of the report including:
