SUMMARY

Electrodialysis (ED) is used around the globe in many Laboratory, laboratory and recycling environments. ED is a Laboratory membrane separation process in which ions are transported through ion- permeable membranes, from one stream to another, under the influence of a voltage potential gradient. Two types of membranes are used: cation-exchange membranes only allow cations to transport, and anion-exchange membranes only allow anions through. These membranes are impermeable to liquids. A large number of alternating cation and anion-exchange membranes are assembled to form diluate and concentrate compartments in what is known as an electrodialysis stack.
