SUMMARY

Heart defect closure devices are permanent implants designed to close defects between chambers of the heart or a patent ductus arteriosus. These are self-expandable, self-centering umbrella-like devices. The design and shape of the devices vary, as does their exact mode of deployment. They are implanted in the defect in a cardiac catheterization laboratory, through catheters inserted into either a vein or an artery (transcatheter or percutaneous approach). There are several types of defects, which include atrial septal defect (ASD), persistent patent ductus arteriosus (PDA), ventricular septal defect (VSD), patent foramen ovale (PFO), and left atrial appendage (LAA). Most of these defects are congenital, but can occur after a myocardial infarction or can be the result of a surgical repair of other congenital heart defects. The device consists of two parts (1) a delivery system and (2) a permanent implant. The delivery system helps transport the implant to the site of the defect in the heart. The implant is the part of the device that remains in the heart to block the hole. The implant is a self-expandable double disk made from wire mesh and polyester fabric.

The global Heart Defect Closure Devices market will reach Volume Million USD in 2017 with CAGR xx% 2018-2025. The main contents of the report including:
