### Summary

Lubricating grease is a solid to semi-fluid product of dispersion of a thickening agent in a liquid lubricant. (A.S.T.M., Standard Definitions of Terms Relating to Petroleum, 1959) Lubricating grease generally consists of a soap emulsified with mineral or vegetable oil. The characteristic feature of lubricating grease is that they possess a high initial viscosity, which upon the application of shear, drops to give the effect of an oil-lubricated bearing of approximately the same viscosity as the base oil used in the grease. This change in viscosity is called thixotropy. Lubricating grease is sometimes used to describe lubricating materials that are simply soft solids or high viscosity liquids, but these materials do not exhibit the shear-thinning (thixotropic) properties characteristic of the classical grease. For example, petroleum jellies such as Vaseline are not generally classified as greases. Lubricating greases are applied to mechanisms that can only be lubricated infrequently and where lubricating oil would not stay in position. They also act as sealants to prevent ingress of water and incompressible materials. Grease-lubricated bearings have greater frictional characteristics due to their high viscosity.

The global Lubricating Grease market will reach xxx Million USD in 2017 with CAGR xx% from 2018-2025. The main contents of the report including:
