Summary

Membrane filtration is a technique which is used to separate particles from a liquid for the purpose of purifying it. The main force of membrane technology is the fact that it works without the addition of chemicals, with a relatively low energy use and easy and well-arranged process conduction. There are two factors that determine the affectivity of a membrane filtration process; selectivity and productivity. Selectivity is expressed as a parameter called retention or separation factor (expressed by the unit $l/m^2\cdot h$). Productivity is expressed as a parameter called flux (expressed by the unit $l/m^2\cdot h$). Selectivity and productivity are membrane-dependent.

The global Membrane Filtration market will reach xxx Million USD in 2017 with CAGR xx% from 2018-2025. The main contents of the report including:
