### Summary

Membrane filtration is a technique which is used to separate particles from a liquid for the purpose of purifying it. The main force of membrane technology is the fact that it works without the addition of chemicals, with a relatively low energy use and easy and well-arranged process conduction. There are two factors that determine the affectivity of a membrane filtration process; selectivity and productivity. Selectivity is expressed as a parameter called retention or separation factor (expressed by the unit  $l/m^2\cdot h$ ). Productivity is expressed as a parameter called flux (expressed by the unit  $l/m^2\cdot h$ ). Selectivity and productivity are membrane-dependent.

The global Membrane Filtration market will reach xxx Million USD in 2017. The objective of report is to define, segment, and project the market on the basis of product type, application, and region, and to describe the content about the factors influencing market dynamics, policy, economic, technology and market entry etc.
