## Abstracts

### SUMMARY

Electric Linear Actuators are electrically powered, mechanical devices consisting of motors, linear guides, and drive mechanisms, which are used to convert electrical energy into linear displacement through mechanical transmission, electro-magnetism, or thermal expansion to provide straight line push/pull motion. Key specifications include the intended application, drive type, motor type, the mounting configuration, as well as other physical dimensions and electrical characteristics. Electric linear actuators are used primarily in automation applications when a machine component, tool, etc. requires a controlled movement to a particular position. They are used in a wide range of industries where linear positioning is needed. The actuators are driven by several means including ball or lead screws, belts, or voice coils, among others. Typical applications include opening and closing dampers, locking doors, braking machine motions, etc.
