Summary

Geopolymers were developed nearly three decades ago by Davidovits who prepared alumino-silicate materials in alkaline at ambient temperature environments. Geopolymers are a type of inorganic polymer that can be formed at proper temperature by using aluminosilicate precursor material, such as metakaolin or fly ash as source materials and adopting alkali activated technology to form a solid binder that looks like and performs a similar function to OPC. Geopolymer binder can be used in applications to fully or partially replace OPC with environmental and technical benefits, including an 80 -90% reduction in CO2 emissions and improved resistance to fire and aggressive chemicals.
