Summary

Virus filtration (VF) is a key step in an overall viral clearance process since it has been demonstrated to effectively clear a wide range of mammalian viruses with a log reduction value (LRV) of 4. The potential to achieve higher LRV from virus retentive filters has historically been examined using bacteriophage surrogates, which commonly demonstrated a potential of 9 LRV when using high titer spikes (e.g. 10¹⁰ PFU/mL). However, as the filter loading increases, one typically experiences significant decreases in performance and LRV.
