SUMMARY

Monochloroacetic Acid (MCA), also called chloroacetic acid, is a bi-functional molecule-structured acid. At room temperature, pure MCA is a colorless, deliquescent crystalline mass. It is very soluble in water, freely soluble in methanol, ethanol, isopropanol, diethyl ether and acetone. It is extensively used as a chemical intermediate for the production of numerous industrially and commercially important chemicals, including glycine, CMC, TGA, and cyanoacetic acid. It is also used in the production of betaine-type surfactants, synthetic caffeine, and vitamins, and the production of 2, 4-D and methanoates for using in herbicides. MCA is commercially produced through the chlorination of acetic acid during the production of acetic anhydride as a catalyst. MCA is marketed in various forms: as a solid (powder or flakes), in molten form (kept at a temperature > 80°C) or as 80% dilution in water. For these forms of packaging, exposure estimates are made.
