## Abstracts

### Summary

An oral syringe is used to dispense liquid medicine into the mouth. It's made up of three main parts: a straw like stopper, the barrel or body and the plunger; some oral syringes also have a cap that fits on the tip of the barrel. An oral syringe has measurement markings on its barrel. It looks almost identical to a hypodermic syringe used to inject medicine under the skin, but uses no needle. Instead, oral syringes have an opening that allows liquid medications to be dispensed into the mouth.
